

River's Edge Stabilisation

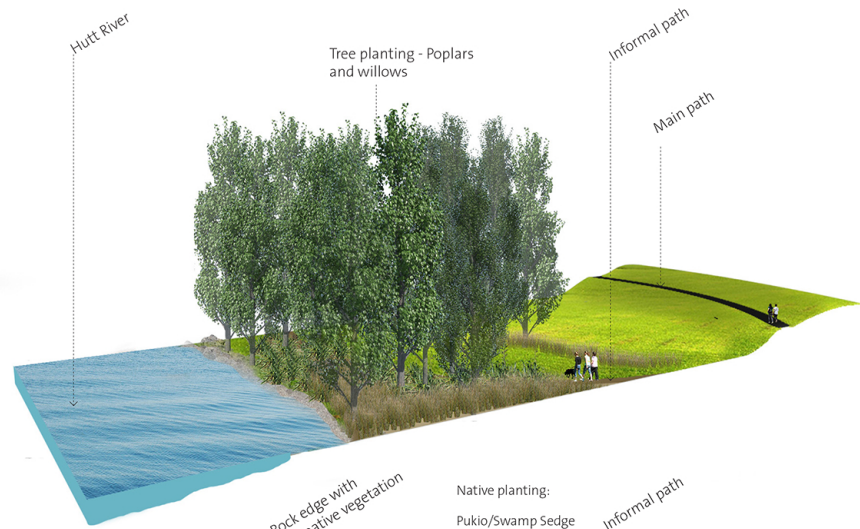

There are 2 main types of river's edge stabilisation - Low vegetated rock edge and tree planted edge.

These edge treatments are both effective methods of stabilisation and are suited to particular areas.

Tree planted edges (D) are suited to more informal parts of the river and provide stabilisation and add amenity value to the river parks.

Low vegetated rock edges (E) are suited to particularly vulnerable parts of the river's edge and urban areas as they provide good access and sight lines to the river.
